

Local Repository Files

- HTML files (structure of web page)
  - divs, classes, inputs, forms
- CSS files (styles, colors)
- JS files (interactive, drag and drop, hover, hide elements)
- Files edited in text editor on your machine (C:/Sbowman/git/)
- Push files when done testing on IIS localhost

Internet Information Services

- IIS acts like a server (the computer that normally has an IP address on the web with web site files), but is for testing your working copy of the repository
- You can set IIS to look at your working copy of the repository, and it will allow you to point your browser to `http://localhost:8110` to see what the web page looks like (8110 is example port number, which is set in IIS)
